The cSTA libraries will attempt to capture the induction and initiation/initial growth of the tuber in an in vitro system as described in Bachem et al. (Plant Journal, 1996). Small microtubers develop from axillary buds attached to stem explants when placed on a high sucrose medium (10%). Visible morphological changes occur synchronously at day five in the axillary buds. The first library, cSTA (1-20) consists of axillary buds harvested on days 1-3. This targets those genes involved in induction of the microtubers. The following libraries, CSTA (21-40) and cSTA (41-60), capture genes involved in tuber initiation and outgrowth. This library is noted as P3 in Tanksley lab notebooks."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Anote—"Vector: PBluescript SK(-); Site_1: ECORI; Site_2: XhOI; Whole plants were challenged with 450,000 sporandia/ml P. infestans US-1(US 940501) in Biotron (Madison, Wisconsin). Leaf tissue was collected at 1, 2, 5, 12, and 24 hours post-challenge and frozen in liquid nitrogen immediately upon removal. Kennebec plants showed no signs of HR. Katahdin plants (susceptible to P. infestans US-1) were used as controls and showed this sequence is actually derived from Phytophthora rather than potato.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Xhol; Tissue was supplied by Dr. Fry (Cornell University). Leaflets and petioles were isolated from 8 week old greenhouse grown plants. The plants were watered and fertilized freely, The tissue was immediately frozen in its mind attractory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

Total RNA was isolated from developing axillary buds of potato nodal stem cuttings cultured on medium for the introduction of tuber formation as described in Bachem et al. (Plant Journal 1996). Tissue samples were taken of stages corresponding to growing stolons and the early stages of tuber formation."

/note="Vector: pBluescript SK(-); Site_1: EcoRI; Site_2:
Xhoi; Tissue supplied by Christian Bachem and Richard
Visser (Department of Plant Breeding, Wageningen
University, The Netherlands). The GSTA libraries will
attempt to capture the induction and initiation/initial
growth of the tuber in an in vitro system as described in
Bachem et al. (Plant Journal, 1996). Small microtubers
develop from axillary buds attached to Stem explants when
placed on a high sucrose medium (10%). Visible
morphological changes occur synchronously at day five in
the axillary buds. The first library, CSTA (1-20) consists
of axillary buds harvested on days 1-3. This targets
following libraries, CSTA (21-40) and CSTA (41-60),
capture genes involved in induction of the microtubers. The
This library is noted as P3 in Tanksley lab notebooks."

Patent No. 5589614

GENERAL INFORMATION:
APPLICANT: BRIDGES, IAN G.
APPLICANT: BRIGHT, SIMON W.J.
APPLICANT: GREENLAND, ANDREW J.
APPLICANT: HALL, DAVID C.
APPLICANT: SCHUCH, WOLFGANG W.
TITLE OF INVENTION: PLANT-DERIVED ENZYME AND DNA SEQUENCES
TITLE OF INVENTION: AND USES THEREOF
NUMBER OF SEQUENCES: 7
CORRESPONDENCE ADDRESS:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                         The present sequence is the potato proteinase inhibitor-I (PPI-I)/Avidin yene fusion sequence. This encodes a chimeric polypeptide comprising Avidin mature peptide, a plant-noxious protein, fused to the ppl-I signal peptide. Transformation of plant genome with the vector carrying the gene fusion can produce pest resistance in plants, plant derived include. Stored harvest material. Pests that can be controlled include, cotton bollworm, tropical army-worm, European corn-borer or red mite, tobacco horn worm, loopers, rice stem borer, poring, outworms, diamondback moth, potato tuber moth, codling moth, indian meal moth, gypsy moth, argentine stem weevil, clover root weevil, grass-grubs, corn rootworm, rice and wheat weevils, mealworms, flour beetles, black field cricket, locusts, sawfiles, Western flower thrips, Hessian flies or

The binary vector is targetted to the vacuole by PPI-I signal sequence. Transformation of plant genome with the vector can produce pest resistance in plants, plant genome with the vector can produce pest resistance in plants, plant genome with the vector can produce pest resistance in plants, plant genome underly and become controlled include, cotton bollworm, tropical army-worm, European corn-borer or red mite, tobacco horn worm, loopers, rice stem borer, porina, cutworms, diamondback moth, potato tuber moth, codling moth, indian meal moth, gypsy moth, argentine stem weevil, clover root weevil, grass grubs, corn rootworm, rice and wheat weevils, mealworms, flour beetles,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BA;

The present invention describes a fibrinogen-converting enzyme fusion protein (FCE). The fusion protein is a multidomain protein comprising:

(a) a FCE; and (b) a first member of a binding pair, that is linked to the FCE chain: (i) directly by bonds utilizing the N-terminal amino groups, the C-terminal carboxy groups or side-chain functionalities; (ii) via a bifunctional linkage motety linking the groups or functionalities; or (iii) by the first member binding to the second member of the binding pair, where the second member of the binding pair is covalantly attached to the first polypeptide chain. The FCE can be used in a method for producing fibrin. Fibrin is useful as a scalant in surgery to, e.g. reduce bleeding by scaling blood vessels, and tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       streptavidin; batroxobin; fibrinogen converting enzyme;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Streptavidin; biotin; anti-interference reagent; detection; mutein; avidin; non-specific binding; ss.
that have been dissected either in surgery or through wounding. The fusion protein allows for the removal of the fibringen converting enzyme from the fibrin sealant preparation via the binding of streptavidin to a biotin solid support. The present sequence encode chicken (Gallus gallus) avidin as given in the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;
                                                                                                                                                                                                       of reducing interference from non-specific binding in assays. Muttains constructed from a Strepted to a Strepted that a Strepted from a Strepted to a Strepted that a binding affinity for biotin of evidin sequence are selected that binding affinity for biotin of less than 1010 L/mole. The biotin-bindable polypeptide may be present as a polymeric conjugate, e.g. With another polypeptide or protein, especially bovine serum albumin. These muteins are used as anti-interference reagents for reducing and/or avoiding nonspecific interactions in a process for detecting an analyte. In particular, they are used in assays where the streptaviolin/avigin-biotin aperticular, they are used in assays where the streptaviolin/avigin-biotin determination of an analyte in a test Sample, e.g. a heterogeneous immunosassay or a hybridistation assay. Despite having a lower binding with native streptavidin and avidin,

This invention describes a novel protein (A) which comprises a membrane-spanning domain and an extracellular domain (ECD), where the ECD comprises biotin-binding activity. Using the proteins or encoding nucleic acid molecules it is possible to target biotinylated molecules to specific sites in tissues. Molecules targeted in this way may be taken up by the tissues or cells by endocytosis, allowing the molecules to exert their effects within or on the cell. This sequence encodes a bovine scavenger receptor class A/avidin fusion protein which is used in
                                            Scavenger receptor class A, ScR, avidin, fusion protein, bovine; ECD, membrane-Spanning domain; extracellular domain; biotin-binding activity; endocytosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New fusion proteins having an extracellular domain with biotin-binding activity, used to target biotinylated molecules to specific sites in tissues -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Alrenne K;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     2066 ccaqcccacctttggcttcaccgtcaattggaagttttcagagtccaccactgtcttcac 2125

```
The present sequence represents a novel DNA molecule which comprises:

(a) a barley alpha amylase promoter; and (b) an optimized DNA sequence derived from the chicken avidin using a codon bias table for maize, which is operably linked to the promoter. A method has also been developed for producing avidin in commercial quantities. The method involves: (a) providing biomass (preferably seeds) from plants, of which at least certain plants contain a DNA molecule comprised of a heterologous nucleotide sequence coding for avidin, where the nucleotide sequence is operably linked to a promoter to effect expression of avidin by certain plants (e.g. the present sequence); and (b) extracting avidin from the biomass. The method can be used for the production of high levels of avidin in native conformation and active form. The constructs can also provide for high level expression of other genes.

                                                                                                                                                                                                                                                                 ö
                             The present sequence encodes potato proteinase inhibitor-I (PPI-I). This is used in the preparation of a binary vector designed to express a chimeric polypeptide comprising Avidin mature peptide. A plant-noxious protein, fused to the PPI-I signal peptide. The binary vector is targetted to the vacuole by PPI-I signal sequence. Transformation of plant genome with the vector can produce pest resistance in plants, plant derived products and stored harvest material. Pests that can be controlled include, cotton bollworm, tropical army worm, European corn-borer or red mite, tobacco horn worm, loopers, rice stem borer, porina, cutworms, diamondback moth, potato tuber moth, coaling moth, indian meal moth, gypsy moth, argentine stem weevil, clover root weevil, grass grubs, corn rootworm, rice and wheat waevils, mealworms, flour beetles, black field cricket, locuts, sawfiles, Western flower thrips,

polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for restore normal activity of (II) is useful in gene therapy techniques (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensize, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        printed

                                                                                                                                                                                                                                                                                                                                                          ŏλ
                                                                                                                                                                                                                                                                                                                                                                                                                   δ
                                                                                                                                                                                                                                                                                                                              ő
                                                                                         is
                                                                                                                                                                                         The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL36511), expressed DNA sequences (ABL16176-ABL36511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                             184 aggaatcgcaagtgtgaacagaagcagtccaaaaacttctatcaaatccgcaatgacaag 243

The invention is useful in developmental biology and in elucidating cell signalling and
                                                                                                                               sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO. at ftp.wipo.int/pub/published_pct_sequences.
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

This nucleotide sequence encodes murine MDC (see AAY05876), a novel macrophage derived C-C chemokine. Murine MDC cDNA was isolated from a mouse thymus cDNA library using rat MDC cDNA (see AAX58335) as probe. Murine MDC competes with human MDC for binding to human CCR4. The invention provides vertebrate MDC polypeptides (see also AAV05871, AAY05877 and AAV05880) and isolated polynucleotides encoding them, as well as vectors, host cells and methods for the recombinant or synthetic production of MDC. Also provided are MDC analogues, antibodies and antagonists. The MDC antagonists are used for the preparation of medicaments for the suppression of the

proliferation of a mammalian immunodeficiency virus, for inhibiting
           platelet aggregation in a mammal, for the treatment or palliation of lupus erythematosus in a mammal, for inhibiting MDC-induced activation, chemotaxis or proliferation of cells that express the chemokine receptor CCR4, for inhibiting or palliating an allergic reaction in a mammal, and for treating asthma (all claimed). MDC polypeptides are also used in claimed vaccine compositions.

The sequence was isolated by searching a seed cDNA library for sequences similar to those known to encode SNF1 in Arabidopsis thaliana, Cucumis sativus, Glycine max and Oryza sativa. The protein is involved in carbon catabolite repression, and so the gene and protein can be used in plants to control the nitrogen and carbon partitioning pathways during plant growth and development. They can also be used to alter the accumulation of carbohydrates, lipids and proteins during plant growth.
diagnostics. The chemokines themselves are useful for treatment of, e.g. cancer or degenerative conditions. Abnormal proliferation, regeneration, degeneration or atrophy may be treated by the inventive compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               carbon catabolite repression; sucrose non-fermenting protein 1;
